Hong Kong: Its Relevance To The Rest Of Us...

...its resistance to the science & technology of social control

Sam FantoSamotnaf

2019

[ed. – The following takes off from developments in social struggles that have rocked Hong Kong, the South Asian former UK island-colony (the last sizable one to be relinquished by the British crown) where British police commanders experienced in riot control were still operating to direct local forces during the revolts of 2019 that this article refers to; and that year the British state invited a Hong Kong delegation to a London arms fair even when they had supposedly halted exports of tear-gas used to quell the rioting...

When Hong Kong was handed over in 1997 from UK rule to that of the so-called People's Republic of China (PRC) it was with special provisions supposedly to prevent the island's complete subsumption into the communist totalitarian state until fifty years later: provisions China has been constantly rolling back ever since. The recent social unrest in particular relates to the legal move to enable the extradition of Hong Kongers (including for 'political crimes' such as selling books banned in the rest of China to locals and visiting mainlanders) to the mainland penal system, while dissidents had already begun to be disappeared for several months at a time. Fears are that the island could be brought to heel by introduction of a similar regime to that the Chinese Communist Party (CCP) operates in Xinjiang (which the West has finally 'noticed' now it's convenient to geopolitically...). Additional steam was added by street actions on the 30th anniversary of the Tiananmen Square protests of 1989 when student protesters demanding democratic reforms were killed in Beijing and around China by the so-called People's Liberation Army. Rioting was sustained and intense for months on end, including after the first wave of COVID-19 temporarily dampened things; the governing Legislative Council was suspended at some points of 2019 due to level of disruption (and being invaded and totally trashed), and general strike has been carried out.

This piece focuses on an aspect normally missed in how many here in the West talked about it (i.e., in terms of national sovereignty) and, unlike the worst of current anarchists, this author takes a hard stance against the rhetoric of democracy that the Hong Kong (HK) movement has too-often espoused. The overwhelmingly-young demonstrators (many being 16-21 years old) have consistently identified, avoided and/or destroyed the infamous surveillance architecture of the regime. The following report, after demonstrators used a portable angle grinder to fell a surveillance tower in August 2019, gives an example of their tactics: "they dismantled the tower, and quickly examined the parts inside. After confirming that the towers were constructed using the same components as the surveillance systems in Xinjiang, more than twenty towers were attacked that day. That evening,

we asked an older comrade what he thought about the action: "This was the smartest thing people could have done. The government said they were not going to be used for facial recognition. The only way to verify that is to tear the thing down." The next day, the company that supplied the parts for the towers announced it was canceling its contract to install an additional 350 of the same "smart lamp posts" [ed. – see Return Fire vol.3 pg31] throughout the city" ('Summer in Smoke: Report from the World's Biggest Black Block'). Also see The Siege of the Third Precinct in Minneapolis for other influencial HK protest innovations .

What follows is only one aspect of the street movement, and is itself only one aspect of the surveillance nightmare that today's rebels face, in London as much as Hong Kong, San Francisco as much as Berlin. (Two years after it was written, it is of course ironic in the (widely-discredited) COVID app tracing age to read the part stating that "in the 'democracies' such crude coercion is not used to force smartphones onto people in the same way": compared to much Orientalist hang-wringing about China today, this author at least emphasises that such technological intrusion is no exclusivity of the PRC.) Our task is to find the cracks in these innovations (which are sold as more effective than they often are; facial recognition for instance usually being easily foiled by wearing sunglasses, etc.) and overtake them, demolish them and lose the fear of their presence in our lives. The fighters (among them, anarchists) of Hong Kong, under one of the most punitive surveillance webs globally, are inspirational in this regard.]

*****

The almost universally-held discourse that the movement in Hong Kong concerns only the people of Hong Kong, China and the Chinese diaspora conveniently ignores the essential: its more general implications for the rest of the masses of individuals throughout the world. Whilst factors specific to Hong Kong are the inevitable catalyst for this movement, implicitly central to it is a resistance to modern forms of science & technology in the service of intensified totalitarian social control – certainly *not* something that only concerns the Chinese.

The current opposition to Hong Kong's proposed extradition law[1] (temporarily suspended *[ed. – though superseded by a similar National Security Law])* is also an implicit opposition to the obvious intensification of totalitarian control that is central to China's current method of maintaining class power, primarily involving the application of science to vastly intensify hierarchical power. An underlying thread running throughout this movement is a resistance to the development of technologically-equipped social control, though in a confused and contradictory manner. This is no tenuous link – opposition to the looming technologically-equipped terror is at the back of the minds of many of the protesters and is at the semi-conscious root of much of its motivation, even

---

[1] For details see this: qz.com/1636663/the-37-crimes-included-in-hong-kongs-proposed-extradition-law/. It's worth pointing out that illegal extradition termed "Extraordinary Rendition" has long been used by "the free world". And China already operates similar things in Taiwan *[ed. – now unrecognised by many countries as distinct from China].* And not just there: *"Kidnappings beyond its jurisdiction have brought the PRC no major negative consequences, opening the door to more cases like that of Gui Minhai (⬚⬚⬚), the Swedish editor abducted in 2015 in Thailand."* The snatching of citizens of other putatively "sovereign" countries is something that the PRC has made a habit of for some time – it has arrogated to itself complete command over every individual of Chinese "nationality" that resides in China or anywhere else. The contentious law of extradition now being used to undermine the remaining bourgeois rights of HK civil society is merely the imprimatur of official "legality" by the local colonial office to sanitize an already routine arbitrary seizure of troublesome people at the will of the CCP. Even Australian kids – though not through extradition – are trapped within China with no complaint from the Australian state. And many Chinese Uighurs who have permanent residency in Australia are fearful of 'rendition' also. And here's a report on a vile little shit who hoped to cash in on extraditing a Chinese dissident from US (impalement is too good for him: he's beyond the pale): aljazeera.com/news/2018/04/elliott-broidy-plotted-force-chinese-dissident-nyt-180420121835645.html.

though this is not always clear or explicit. This is certainly implied by this report from June 14th: *"...a recirculated South China Morning Post report from last December has sparked concern that a visit to Xinjiang* [Muslim Uighur region where at least 10% of the population are in education camps] *by Hong Kong anti-terror police, ostensibly to learn rapid incident response methods, may be a sign that HK authorities may have been importing ultra-repressive security measures from the region."* And these fears are *explicitly* stated by some of those involved in the Hong Kong movement: *"Hong Kong's tech-savvy protesters are going digitally dark as they try to avoid surveillance and potential future prosecutions, disabling location tracking on their phones[...] Who knows if it would become like Xinjiang the day after tomorrow, because things can change so quickly".[2]*

One can see an aspect of this also in the use of umbrellas to hide from drones.[3] Another has been the avoidance of electronically traceable railcards by those going to the demonstrations: *"Many of the protesters ...took pains to keep from being photographed or digitally tracked. To go to and from the protests, many stood in lines to buy single-ride subway tickets instead of using their digital payment cards, which can be tracked...".[4]* And here:[5] *"Local Hong Kong residents almost never use these ticketing machines these days to buy single-journey tickets. For starters, everyone has a rechargeable smart card, called the Octopus card, that is widely used across the city to pay for everything from transport to meals and groceries. Purchasing a physical ticket not only takes time, it also costs more than the equivalent trip paid for with the Octopus card. The protesters' deliberate decision to use cash, despite its seeming inconvenience, also shows how increasingly cashless societies can present dire privacy concerns."*

Nevertheless, many used the supposedly encrypted mobile chat app Telegram, oblivious to the fact that the state (both that of mainland China and Hong Kong) have long ago hacked this app.[5] *"Telegram is not more secure than Whatsapp. In many circumstances, it's worse[...] its encryption features, were highlighted by tech media as one of its big selling points. Despite its reputation, many conversations on Telegram are not end-to-end encrypted – in other words, not secure. And to make matters worse, the company has developed a reputation for problems with its technology that have led some users to have their information and messages exposed, in some cases to other users. Over the past year, Global Voices has reported on multiple instances of Telegram users running into serious trouble with the app's security. Telegram users in Russia – some of them journalists and activists –*

---

[2] hongkongfp.com/2019/06/14/become-like-xinjiang-surveillance-savvy-hong-kong-protesters-go-digitally-dark/

[3] It's worth pointing out a development in drone technology that so far has not been used (as far as I know): *"The drone features four high-powered gas propelled chambers, each of which is capable of firing 20 pellets per second. It is also capable of firing other similar-sized pellets, including paintballs and solid plastic balls with an ammunition capacity of 4,000 pellets. While the company has not disclosed the recipients of these mobile projectile dispensers, Desert Wolf's managing director Hennie Kieser told the BBC that many of them are based in South Africa. "Some (are) mines in South Africa, some security companies in South Africa and outside South Africa, some police units outside South Africa, and a number of other industrial customers." (siliconrepublic.com/digital-life/item/37317-airborne-riot-control-pepp?)* ...but even drones are not immune from a crowd's desire to enjoy themselves (more here: latimes.com/local/lanow/la-me-ln-kings-game-drone-no-owner-20140616-story.html) *"After a light tap from an unidentified object on its left side, a black Kings T-shirt knocked the drone on the right and sent it careening down within arm's reach of the fans. Video footage shows the drone getting pulled into the mass, where it was smashed to bits by a skateboard".* However, attacking drones or sheltering from them by using umbrellas necessitates that one recognises a drone when you see one. China can now get round this by using drones that look like doves for surveillance (and in France, the state is training eagles to bring down hostile drones).

[4] nytimes.com/2019/06/13/world/asia/hong-kong-telegram-protests.html

[5] See this: advox.globalvoices.org/2016/08/09/dear-hong-kong-activists-please-stop-telling-everyone-telegram-is-secure/

have reported that their accounts were hacked. Another user in Ukraine reported receiving private group messages through her Telegram app for a group that she was not part of. And there has been concern in Iran about the company's compliance with government requests for certain material – bots [ed. – accounts run by automated programs] mainly – to be blocked on the platform."

An underlying fear of the movement in HK is the totalitarian nature of China and its use of surveillance technology to repress dissidence before it hits the streets, schools, universities or workplaces. Such technology is already being used to a lesser degree in Hong Kong: people have been arrested merely for discussing organising the protests on their smartphones.[6] Surveillance technology is the constant fear – *"Even if we're not doing anything drastic – as simple as saying something online about China – because of such surveillance they might catch us"…Many said they turned off their location tracking on their phones and beefed up their digital privacy settings before joining protests, or deleted conversations and photos on social media and messaging apps after they left the demonstrations…Anxieties have been symbolised in a profile picture that was being used by many opponents of the bill: a wilting depiction of Hong Kong's black-and-white bauhinia flower. But protesters have become increasingly nervous that using the picture online could attract attention from authorities and have taken it down".*[7]

Some of the confusions and limitations of this movement are obvious. For example, there's an illusion that the extradition law will stop foreign investment in Hong Kong – *"We're afraid that in the future we won't have jobs to go to"*, some teenagers have said.[8] Nonsense, of course. Whilst some individuals working for businesses may feel reluctant to go there, companies as a whole nowadays have no compunction about complying with mainland China (and, of course, this is independent of any basic critique of jobs, of the misery of wage labour). And sadly, this illusion detracts and distracts from the main reason for this movement – their resistance to impending totalitarianism. This resistance can certainly not be won if they somehow believe that they can rely on the wafer-thin margin of freedom expressed in the lesser forms of totalitarianism implicit in current bourgeois democracy.[9] Whatever obviously totalitarian countries pursue is merely one

---

[6] For just one example, see this: globalvoices.org/2019/06/14/in-hong-kong-authorities-arrest-the-administrator-of-a-telegram-protest-group-and-force-him-to-hand-over-a-list-of-its-members/

[8] chuangcn.org/2019/06/anti-extradition-translations/

[9] More than just 'sad' are the ideological expressions of how wonderful this margin of freedom is. Whilst no-one wants their lives to get worse, which given this catastrophic epoch is almost inevitable outside of a growing social movement to fundamentally change the world, articles by this French admirer of the neoliberal Macron (see, for instance this: theguardian.com/commentisfree/2019/mar/07/macron-europeans-french-president) praising the Hong Kong movement whilst parading the 'universalism' of republican values, just contribute to illusions in 'democracy', the very ideological manipulations that were used by the French ruling class to justify going to war with Germany in 1914, leading to the massacre of over 1,500,000 soldiers on the French side. She talks of *"the right to speak freely"*, which conveniently ignores the very obvious fact that if you exercise your "right" to free speech to a teacher, to a boss, to a cop, etc. you find your speech is not so free at all. Besides, speech is colonised by the monologuers of the media, and inculcation by the official educators and of all the dominant forces of pseudo-communication. Originally, in the 18th century in France and beyond, the demand for "free speech" had something radical about it, insofar as it opposed the monopoly of ideological expression spouted by the monarchy, the aristocracy and priesthood. But the ruling class are the only section of society who have the power to put their free speech into effect, whose ideas have the most obviously concrete consequences; for the rest of us, it's a constant battle to express ourselves freely, and we do it at risk of being imprisoned or crushed in other ways. An example of this in France at the present are the arrests for the crime of 'outrage' of some people I know a bit, who have been accused of chanting *"A cop who commits suicide is half-forgiven"* – the prosecution is calling for the maximum sentence of 2 years in prison (meanwhile, the killing

4

step ahead of the 'democracies', which slowly but surely also develop similar methods of social control, constantly obscured, however, by the language of "rights".

Joshua Wong, one of the leaders of the 2014 Umbrella Movement, who was recently released from prison, possibly to calm things down, has written *"As American security and business interests are also jeopardized by possible extradition arrangements with China, I believe the time is ripe for Washington to re-evaluate the U.S.–Hong Kong Policy Act of 1992, which governs relations between the two places. I also urge Congress to consider the Hong Kong Human Rights and Democracy Act. The rest of the international community should make similar efforts. A victory for Beijing is a victory for authoritarianism everywhere. Keeping an eye on this place sends an important message to Chinese authorities that democracy, not authoritarianism, is the way of the future. It also keeps our hopes alive knowing that we are not fighting alone."* This is the kind of rubbish one would expect from a politician, however apparently 'dissident' (he's secretary-general of the pro-democracy party Demosistō). Apart from the fact that it takes sides in the cold (and potentially hot – check out tensions around Taiwan) war between China and the USA, it's a typical example of the current colonisation by dominant language – phrases such as *"international community"* which merely means the international *"community"* of capitalists, whether state capitalists or individual capitalists. This is the "community" of the commodity which Wong clearly hopes to have a political niche in. And of course, his contrast between *'democracy'* and *'authoritarianism'* nowadays makes little sense – democracies everywhere are becoming increasingly authoritarian and we hear of so many new examples almost every day that this text would run to 1000s of pages if I were to list every one of them over the last few years – it's sufficient to note the ones mentioned here and there throughout this text. But so far there's a difference between authoritarianism and totalitarianism, even though it's also vital to realise that totalitarianism grows out of the polluted soil of authoritarianism.

---

in Marseille of an 80-year-old woman closing the shutters of her flat by cops firing teargas grenades on a 'yellow vest' *[ed. – anti-austerity]* demo last December has led to no prosecutions whatsoever). To quote T: *"Democracy, like all other tools for the false unification of antagonistic forces, is based on abstract concepts: "rights", "justice", "equality before the law" "rule of the majority" etc. Their abstract nature conceals (and meant to conceal) their concrete use. "Rights" are an historical product of a violent war between owners and non-owners which produced and reproduces capitalism and its classes, its money and wage-slavery, their inherent misery and contradictions. Rights were created at a certain point when the bourgeoisie and its copy-writers were forced to come up with a way to reform its exploitation and abuse, to refine their methods of enslavement. As subordinates of a hierarchical power, we are "granted" rights after-the-fact, after that same power had already taken by force our freedom to create and decide about our so-called lives. One of the biggest lies is the "right" to be a slave and to exchange the life that is stolen from you every day for crumbs of survival and alienation. You now have judicial rights that (only technically) guarantee some level of this survival, abstract equality and a "just" legal procedure only because the owners of society were forced to grant those rights when the fierce resistance of the slaves (traditional slaves and wage-laborers) became a real threat to the entire system of production and its hierarchy. The revolts and insurrections that forced the owners to abolish the traditional forms of slavery have not yet brought about the total abolition of slavery, only its modernization and its accompanied rebranding, an official equality for everyone in the powerlessness over their own lives.* Everyone in a democracy is "equal" before the laws of governance and the justice systems that are perhaps dictated and ministered by democratically elected bureaucrats, but are inherently designed in such a way so that not only they cannot change the established order of alienated life, private property, owners and non-owners, of those who decide and those who take orders – they also reproduce and anchor in our minds a mystical belief in the absolute rightness of those systems and the order they protect. But everybody knows, even those who are still under the mystique of this alleged "lesser of evils of all forms of government", that even the rights and the "welfare" that are given to us under the law are corrupted daily and in secrecy, without possibility of redress. Judicial law will always be subordinate to the more fundamental laws of this society."

The ideology of self-determination put forward by his party is an ideology that's been around since President Wilson advocated it as a tactic in the US's struggle for imperialist hegemony at the end of WWI, an ideology where the vast majority of "selves" determine nothing. And besides, no rulers of any state can determine their country independently of the pressures of the global market. Wong's appeal to the US state contradicts this ideology of 'self-determination'. The constant shifts, between the various capitalist states, from rivalry to complicity, from competition to alliance, and back again, the inevitable product of the different states' balance between mutual dependence and rival economic interests, means that the US can't be relied on even as an ally of those aiming to mobilise (some of whom want to eventually *rule*) Hong Kong against the rulers of China. After Tiananmen Square, the US imposed sanctions on China, which however, did not stop George Bush snr. from secretly doing deals with the Chinese bureaucracy immediately after the massacre of at least 10,000 Chinese workers and students. And at the end of May [2019], just a few weeks ago, the Belgian state, through its Beijing embassy, in an unprecedented move, called on the Chinese police to arrest and disappear a family of Muslim Uighurs seeking visas to enable them to reunite with the father of the family in Belgium: *"Belgian officials say their small country can't risk offending China"*. When Wong refers to the *"international community"* and *"knowing that we are not fighting alone"* he's encouraging illusions in so-called allies who will, if convenient, stab such 'friends' in the back.

"Not fighting alone" can only be developed by striving to recognise and act on the connections between different struggles amongst those who are fighting their own states and bosses and the market system not only in mainland China but also throughout the world.

Do Chinese Bureaucrats Dream Of Electric Sheep?: China as world leader in the development of technological social control

However, the fear of Hong Kong becoming more like the mainland is also engendered by knowledge of the advances there towards the most totalitarian use of social control technology in history. For the few reading this who don't know – in a year's time the state there will have completed its database of the whole of the population, a database intended to standardise the assessment of everyone's economic and social reputation, or 'Social Credit': a database of every individual's recorded incident from the cradle to the grave. Some aspects of this 'social credit' system are already being used 'voluntarily' in apps in China by a combination of both the state and private industry, called "new forms of behavioral incentivisation."

Already, in the Muslim Uighur area, one of the areas that in the past that has had significant revolts against the Chinese authorities, the Chinese bureaucracy is collecting the DNA of most of the Uighur population.[10] The state is also demanding that *"all neighborhood households' cutting tools with blades exceeding 10 centimeters [have] QR codes embossed on them"*, and enforcing this demand by the use of spot 'security checks' (perhaps even by China's new Dalek-cops).

China is universally recognised as the world's no.1 country in the production of the technological means of social control. The cops there now have sunglasses with in-built facial recognition technology to facilitate the rulers' law enforcement. Not only is facial recognition surveillance capable of picking out a wanted individual amongst a crowd of 60,000, but their facial recognition cameras are now starting to be used in school classrooms because they can also recognise a person's *mood*: anxious, furtive, scared, happy, disgusted, sad, surprised, angry, neutral, discombobulated or desperate-for-a-piss. *"The system has been touted as a way to ensure students are at-*

---

[10] See also: dialectical-delinquents.com/articles/daily-life/the-myths-of-dna/

tentive and happy, learning quickly and, ultimately, scoring well on tests.”[11] In addition, schoolkids are obliged to consult an app on their phones mixing information with Xi Jinping Thought *[ed. – ideology of President Xi Jinping].“Schools are shaming students with low app scores. Government offices are holding study sessions and forcing workers who fall behind to write reports criticizing themselves. Private companies, hoping to curry favor with party officials, are ranking employees based on their use of the app and awarding top performers the title of “star learner.” Many employers now require workers to submit daily screenshots documenting how many points they have earned.”*[12]

Fortunately, some Chinese people have not been so intimidated as to avoid speaking out against this suffocating development: *“This technology is so twisted. It’s anti-human,” said Zhang Jing, a 23-year-old photographer who spoke out online about the Hangzhou classroom. He envisioned a future where teachers demand students to smile in class and “then there’s no difference between students and robots, right?”*[13]

China now has school uniforms that, along with the ubiquitous facial recognition, track students’ comings-and-goings, which make truancy almost impossible. Whilst facial recognition cameras in the classroom inform teachers if a student has fallen asleep in class in case they hadn’t noticed (but this is very unlikely considering how thrilling their studies are – *“primary school textbooks may soon include definitions for terms like “price-to-earnings ratio” or “buy and hold”[15]*).

And in certain areas, sanitation workers are being required to wear GPS-tracking smart bracelets to not only monitor their location at all times, but audibly prod them if they stop moving for more than 20 minutes. And just in case you think that this is merely an example of the development of totalitarianism in China alone, take a look at this development in Canada, only in its initial stages: *“Researchers at UBC Okanagan’s School of Engineering have developed a low-cost sensor that can be interlaced into textiles and composite materials. While the research is still new, the sensor may pave the way for smart clothing that can monitor human movement. The embedded microscopic sensor is able to recognize local motion through the stretching of the woven yarns that are treated with graphene nanoplatelets that can read the body’s activity”.*[14]

Moreover, China’s voice recognition technology as a means of social control is certainly going to be developed way beyond its borders. And whilst voice recognition is paraded as simply a tool for ‘writing’ without using one’s fingers, its use for the police is obvious (though *so far*, it’s a rather haphazard tool, since disguised accents can fool it, and also voices can be scrambled). And there are also certain areas where you can only get toilet paper if you’re on the facial recognition database, apparently aimed at preventing toilet paper theft and rationing toilet paper use. If Orwell’s 1984 had envisaged a world where Big Brother restricted how much paper you used to wipe your arse and knew how often you took a shit he would have been thought of as deliriously absurd.

In parts of the country, facial recognition is used to shame the horrific crime of jaywalking: *“The public shaming has very visible effects …being publicly shamed could impact a person’s credit rating, as well as their insurance and pension premiums.”[17]*

[13] ibid.

[14] sciencedaily.com/releases/2019/05/190516142923.htm

China's state even uses "Minority Report"-type predictive policing for those they believe will commit what they have designated as a crime.

Orwells That Ends Well: From China to the rest of the world

"This is not just about Xinjiang or even China – it's about the world beyond and whether we human beings can continue to have freedom in a world of connected devices[...] It's a wake-up call, not just about China but about every one of us." – quote from this[15] article about the horrendous affects of predictive policing in China's Uighur areas

So don't delude yourself into thinking that these developments will remain purely within China's borders. Predictive policing technology, for example, is being taken up by police departments throughout the world. Moreover, China's social credit system "could interfere in other nations' sovereignty" (ignore the ridiculous title – the notion of national sovereignty has always been dubious, even within its own bourgeois terms). On top of all this, China's renowned use of internet censorship is being increasingly adopted throughout the world. And just the other day, on 19th June [2019], Google rejected attempts by many of its shareholders to close down its "Project Dragonfly", a censorship- and surveillance-enabled search engine designed to facilitate the company's return to the Chinese market.[16] In Germany, the state closed down Indymedia in August 2017, saying that they were intent on destroying the German Constitution.[17] And now the

---

[15] chinadigitaltimes.net/2019/05/hrw-report-reveals-how-xinjiang-police-profile-uyghurs/

[16] Due to technical problems, this footnote is divided into 2 parts, firstly about Google, then about Germany. On 18/12/18 Google stepped back from its Big Brother collaboration with the Chinese bureaucracy. This was essentially because principled individuals within the company exposed the machinations of the Google techno-authoritarians, but it seems like it was only a temporary retreat. Developments of this kind are expressions of core capitalist values and should be expected by all those who have an inkling of how the system works. The other half of the subject matter covered in this article illustrates the degree to which capital has become entangled with the business of legitimizing authoritarianism – openly, on a contractual basis. In October 2018, Google's CEO defended helping the Chinese bureaucracy's censorship plans, a reversal of a decision from about eight years ago, when Google pulled its search engine, which was also censored, from the Chinese market. The CEO said the time had come to reevaluate that choice. *"It's a wonderful, innovative market",* he enthused so as to justify the logic of capital accumulation by working for the genocidal Chinese police state. Also notable was the opposition within the company. In September 2018 Google's upper management forced employees to delete a confidential memo detailing the censored search engine the company was planning to launch in China, indicating a certain similarity between the surveillance the Chinese state imposes on its citizens and that which Google imposes on its workers. In August 2018, there'd been some resistance to Google's collaboration with the totalitarian state in the form of a petition against this project, but it's indicative of the climate of fear in the company that one of the employees who helped organise it wished to stay anonymous (see also this: chinadigitaltimes.net/2018/08/anger-grows-over-googles-china-plans/). Germany: And in May [2019] the German state allowed for detention without trial for up to 35 days for those who the state thinks might commit a crime. This law is called the "Polizeiaufgabengesetze" (police tasks laws), which were first introduced in several German "Länder" (regions) last year. These laws give the police the right to arrest suspects in certain cases to prevent them from committing a crime, to imprison them, BEFORE they have done anything against the law. There is no trial but the person would just be released after the event the "suspected threat" refers to is over – e.g. a football match or a political summit. There was a lot of public outrage against these laws last year and large mobilizations by a broad spectrum from liberals to Leninists to more radical factions. In the end, the politicians made some minor changes (specifically, reducing the detention period from 74 to 35 days) which preserved the essence of the laws and passed them. True to current Kafkaesquisms *[ed. – see Return Fire vol.2 pg52; i.e., legalese nonsense]*, those arrested are not informed of any offense they are suspected of being about to commit.

[17] Democracies' interaction with more fascistic forms is not confined to censorship of course. For instance, read this report about a Hong Kong-based American security company, whose head was responsible, under the aegis of the US state, for killing 14 unarmed Iraqi civilians, helping the Chinese ruling class to set up a training centre in Xinjiang: theguardian.com/world/2019/feb/01/blackwater-founder-erik-prince-to-build-training-camp-

UK could well be bringing in a law allowing for "North Korean-style censorship".[18] Sure – they often overkill with excessive suggestions to test the water before a bill is debated so that when they finally re-phrase some of the more obviously draconian features they can show they've "listened" *[ed. – as seems to possibly be the case with the much-protested UK bill of this year; see 1 May 2021...]*, but bit by bloody bit internet – and other – censorship is very obviously on the increase in the de*mock*racies.[19]

Countries and institutions outside of China constantly and hypocritically condemn the move towards totalitarian social control in China in order to make a show of differentiating their 'freedoms' from more overtly repressive conditions. And to more insidiously develop similar repressive controls hidden behind this show of contrast. Behind this show, in practice capital outside China needs China's vast mutual trade and investment – e.g. the Belt & Road/Silk Road initiative, embraced especially by the far-right Italian government and France's neoliberal one, though it also involves infrastructure development and investments in 152 countries and international organizations in Europe, Asia, the Middle East, South America and Africa. Meanwhile sections of capital outside China are eager to develop similar surveillance technologies and are both supplying much of them to China as well as buying them from there (see, for example this[20] and this[21]). At the same time, Chinese internet censorship methods are being exported throughout the world (for some of their methods, see this about censorship of the protests in Hong Kong[22] and this[23] about censorship there generally), and increasingly it's being acknowledged that its surveillance techniques are also being exported everywhere.

'Mood recognition' camera technology is not in any way confined to China but is being developed elsewhere, though not always directly in the form of forms of legal or state-initiated repression but as a method of market research and consumer manipulation. *"A supermarket might use it in the aisles, not to identify people, but to analyse who came in in terms of age and gender as well as their basic mood. It can help with targeted marketing and product placement."[24]* But there *are*, outside of China, the usual 'law enforcement' uses for such Big Brother technology: *"UK firm WeSee, for example, claims its AI tech can actually spot suspicious behaviour by reading facial cues imperceptible to the untrained eye. Emotions, such as doubt and anger, might be hidden under the surface in contrast to the language a person is using. WeSee says it has been working with a "high profile" organisation in law enforcement to analyse people who are being interviewed."[25]* As if this wasn't enough to maintain repressive social control, the Chinese state is now developing 'gait recognition': *"...the system can identify people from up to 50 meters away, even with their*

in-chinas-xinjiang. And there was a recent report showing British cops training Sri Lankan war criminals in riot practice.

[18] theguardian.com/technology/2019/apr/08/online-laws-threaten-freedom-of-speech-of-millions-of-britons

[19] As an example of how totalitarianism is beginning to develop also in a country widely believed to be resisting neoliberal forms of this totalitarianism, it's worth noting this: a social network site in France set up a collection at the beginning of January this year for an ex-boxer, Christophe Dettinger, who punched a cop during a 'yellow vest' demo and later got a 30 month jail sentence. The state not only blocked the bank account of this collection (they'd accumulated over 100,000 euros in just 2 or 3 days) but also officially summoned 56 of the people who'd donated money to this site – apparently anonymously – to explain themselves at their local police station.

[25] Ibid.

back turned and their face covered. "Gait analysis cannot be fooled by simple limping, walking with splayed feet or hunching over, because we are analyzing all the features of an entire body".[26] In the meantime, before such technology is fully developed, *"the police can use hand-held devices to search smartphones for encrypted chat apps, politically charged videos and other suspect content".*[27] And in Xinjiang residents are forced to install surveillance apps on their mobile phones.

Of course in the 'democracies' such crude coercion is not used to force smartphones onto people in the same way. Nevertheless, for increasing kinds of means of survival, smartphones are as "compulsory" as cars have become for many in this society – no Deliveroo rider or Uber taxi driver or care worker would hold onto their jobs for longer than 10 minutes without one, and there are certainly many other forms of wage labour that require them. And they surveille all movement, to the point where it's impossible, if you want to hold down your job, to not conform to a kind of modern form of utterly isolated individualised time and motion control where the smartphone polices your speed, your time of arrival and departure and probably more. Of course, in democracies such wage labour is "voluntary" – wage slavery is not like slavery but allows you "freedom", to use a word favoured by liberal ideologists, evasively contemptuous of the condition of those who have no other way to survive but to sell their labour power. Sure, you can try to avoid using smartphones for anything that might draw the attention of the state, but if the state already has you in its crosshairs, it still has your phones at home and at work to tap.

At the same time, the smartphone is not just a means for the most obvious forms of social control such as police surveillance. It's also a mediation of immediate relations and is thus also a way of being sucked by specialised effects and other artistic forms into a distraction from non-virtual human contact *[ed. – see the supplement to Return Fire vol.4; Caught in the Net]*. In the democracies, smartphones are not compulsory yet. But people get hooked on them – seduced by the attraction of endless applications of narrow aesthetic 'subjectivity' – and then, like all drugs, are finally controlled by and through them. Whilst with the more normal notion of what constitutes a drug habit, being controlled by drugs is subjective and can, with effort and a sense of purposeful perspective, be resisted and eventually kicked, in the case of addiction to technological toys, the control is not just subjective, voluntary, not just dependent on will. It's not just you watching Big Brother but Big Brother Watching You 24/7.

There's been, in the UK, in the development of electronic tagging (the 'nice' alternative to the totalitarian panopticon *[ed. – see Return Fire vol.4 pg8]* of prisons) a device that can monitor adrenalin, alcohol and anger levels, and heightened tension.[28] And I've heard, in the US, that there's a personal yoga meditation program available which monitors your moods – priceless data about someone that would be easy for the state to hack into. How much more invasive is it possible to get? These technologically-based elements are clearly pieces constituting an enormously enhanced system of social nano-control, one that was always embedded in capitalism's project of what [Cornelius] Castoriadis referred to as "pseudo-rational pseudo-control", but which, as the world falls increasingly into ecological collapse, wars and crisis, can and will – insufficiently contested – be justified as a means of "maintaining order".

Of course, the powers-that-be invariably present themselves as far more omnipresent, omnipotent and omniscient than they in fact are in order to induce a soul-destroying resignation

[26] securitytoday.com/articles/2018/11/12/new-surveillance-tool-gait-recognition.aspx

[27] chinadigitaltimes.net/2017/12/advanced-surveillance-spreading-xinjiang-across-china/

[28] See this: dialectical-delinquents.com/articles/uncategorised/hidden/lord-of-the-meanderings/hong-kong-trying-to-block-the-road-to-totalitarianism/prison-technologies-stoa-report/

amongst those who might be tempted to revolt against their power. It should be made clear that one of the strategies of the state – for a long time – has been to make people think that the state is like a materialist God – it knows and controls everything. Its presentation of itself is intended to instil absolute resignation*: "You can't beat the system"*, as a widely-distributed ad warning against fare-dodging on the tube put it – in London as far back as *the 1980s*! Although the means available to it now is far vaster, petrification – terror and submission – in the face of it all is what the rulers want above all, as if the technological means of absolute control at the disposal of the state is perfect, regardless of how much, in fact, it is. As this article says about America's accumulation of data by the NSA [National Security Agency]: *"...while capturing and storing data is easy, data by itself is not information. The NSA's enormous capability to intercept data has not been matched by any corresponding ability to analyze it, much less to act on whatever information is extracted. Data mining has shown some promise in keeping track of known suspects, but has been nearly useless at uncovering new ones. The forces of order are therefore left to wrestle with unmanageable masses of data on people who are little threat to them, while those harboring nefarious intent can slip beneath the radar merely by taking some basic precautions".*[29]

So, in relation to facial recognition cameras, awareness of how social control technology works can help you consciously alter your image and behaviour. Actors know full well that gait can be disguised by imitation of others and not just something you can disguise by the far-too-simple use of limping, walking with splayed feet or hunching. Actors know full well that mood can be consciously repressed, for example by recalling situations one has lived other than the real life actually being lived, or imagining and empathising other people's situations. Such professional techniques can be used outside any professional career, in daily life, by those who have developed a certain distance from their own habitual facial expressions and body language, though of course, this reduces the element of spontaneity in resistance to external authority: one has to always calculate a risk well beforehand, though some aspects of calculation can become easy routine habits with constant repetition. As for facial recognition's ability to see a discrepancy between one's words and one's micro-expressions, in certain circumstances/countries one can still refuse to talk to law enforcement agencies. And refusing to be sucked into the dead-end of consumerism, and to predictable consumer habits, can enable people to avoid being seduced by *"targeted marketing and product placement"*. Nevertheless, this remains a purely individual solution under siege to the watchful eye of the state constantly looking at every breath you take, every move you make, every step you take, every single day, every word you say, every game you play, every vow you break, every smile you fake, every claim you stake. Despite the danger of over-estimating such technologies, there's also a danger in under-estimating them: it's well-known that the thought of being constantly surveilled causes an enormous amount of stress, which wears and tears at each person (there are even some people who cover the camera on their mobile phones for fear of having their every activity monitored, even though they don't even do anything or discuss anything illegal). As previously said, totalitarianism, any more than any other *ism,* is never a completed goal – there were even revolts in the Nazi's concentration camps and in Stalin's gulags.[30] But it certainly is a process constantly capable of extension and intensification.

Holidays in Your *Own* Misery: Totalitarian leisure

[29] isiw.noblogs.org/post/2014/09/29/two-pieces-on-surveillance/
[30] E.g. this: en.wikipedia.org/wiki/Vorkuta_uprising

It has to be made clear that the development of totalitarian technology is also already pervasive in areas of life considered to be 'free'. As a compensation for being robbed of the freedom to change your world and your life, you are granted the freedom to change compensations. Such compensations turn communication into its opposite with those "feeds" or supposedly personalized "suggestions" and "recommendations" pushed on you by Smartphone apps, Youtube, Facebook[31] et al. or disguised as articles (those "Around the Web" and "Recommended For You" boxes at the bottom of many online news articles, created by advertising companies such as Taboola etc.), who ask you over and over again and without your initiative, to pick and choose from what they have "for you", creating by this the habit of staying within the comfort of their clickable bosoms. What was once a personal and passionate exploration of thoughts and knowledge that began by your own initiative, of which an important part was the social exchange of recommendations and ideas between people who actually know and communicate with each other – a direct experience that could lead to discussion and to a mutual development of the people engaged – has, for the obedient spectator who's only inquisitive about what this society deems acceptable to be inquisitive about, been eliminated and replaced by an isolated and unilateral absorption of material intentionally designed to serve itself and to be consumed repeatedly: easy-to-access (directly available at any moment, especially those moments of void, when boredom or anxiety kick in), easy-to-process, having a harmless, purely entertainment/educational/commercial value, as well as leaving no room for surprises, chance and the unpredictable. What we have here is a vertical edification, identical to all, of which the form guarantees that the content remains confined to the limits of the form. These platforms (and the capital and exploitation behind them) derive their full power precisely from isolation and passivity, and they create isolation and passivity in

_____

[31] A few people only see in Facebook the epitome of a narcissistic culture whereby people *voluntarily* expose their intimate moments and personal life to strangers in order to get attention. They only see it as the playground for a pseudo-communication organized in the form of "likes" and a self-promotion on their own page, on their own media. Which, even if partially true, is a very narrow, reductionist, take on it. Elements that are putatively "personal" are part of an integrated order of generalized social control, as well as artifacts of the contemporary conditions of class struggle. Naive and vulnerable youth, growing up in a culture where Facebook is as banal a part of social life as TV used to be, write whatever comes into their heads and then find their innocent writings being used against them or to pressurise them at some later date. For instance, in August 2011 a young guy (in Wolverhampton, if my memory serves me well) wrote "*Let's have a riot in the town centre!*" (or something like that) on his Facebook page. Despite taking it off Facebook after 20 minutes, he was arrested, tried and sent to jail for at least a year – for inciting a riot that never took place! In addition, the idea that the kind of self-promotion one sees routinely in social media (esp. ones utilized for seeking work like Linked-In) are simply individual psychological aberrations caused by a purely voluntary engagement with Capital, fails to take into account the extent to which people are *forced* to market themselves in order to secure employment (and are thus another symptom of precarity) as a consequence of, amongst other things, the destruction and marginalization of the more traditional expressions of class struggle. Also, an increasing minority of people use it for political discussion. And in France at least, it's often been used – and this since 2010 – to gather people together for political reasons (in 2010 high school students used Facebook to organise strikes to support the anti-pension reform movement; in 2018 the yellow vest movement was initially started by Facebook discussions). And not just in France – Facebook contributed to the Arab Spring *[ed. – see Return Fire vol.2 pg87]* in Egypt (though, admittedly, this was much exaggerated by the Egyptian middle class, since the majority of participants didn't have internet access). Even amongst non-political teenagers, it's been used for genuinely social self-organised events: dialectical-delinquents.com/articles/daily-life/france-facebook-festivals-may-2010/. Whilst the critique of narcissism is partly pertinent – it's certainly worth critiquing the shallowness of individuals' lives and communication partly resulting from what they 'choose' (within their ever-narrowing margins of choice) – it's important to also look at what is *not chosen* and what is *not narrowing*, what is objective and partly and increasingly determinant – the widespread use of this information by businesses and the state, who gather this data for obvious manipulative purposes as well as to check for deviant tendencies (see, for instance, this recent new requirement for a US visa: bbc.com/news/world-us-canada-48486672).

return. This may not seem like direct censorship, but its effects on mental capacities and social relations are often even worse.

"*If I have only an historical knowledge of thought, truths, and facts, they are outside my spirit; i.e. for me they are dead; my thinking and my spirit is not in them; in them my thought is not present, and my inmost being is not there either. The possession of purely historical facts is like the legal possession of things I do not know what to do with. If someone stops at the mere knowledge of what this or that man has thought, of what has been handed down, then he has just handed himself over and renounced what has made him a man, namely his thinking. In that event he is preoccupied solely with the thinking and the spirit of others; he investigates only what has been true for others.*" – Hegel *[ed. – see Return Fire vol.4 pg55]*, Introduction to the Lectures on the History of Philosophy

An endless amount of pieces of information are streamed, uploaded, broadcasted or talked about in Youtube-channels, Facebook-live and similar platforms – but on the condition that they remain pieces of information or entertainment, that they remain details. They then (or while you're watching them) immediately recommend you to continue and click on other sources of the same kind, so that you will never be out of the loop. Only what is telegenic is allowed, that which can represent or sell an already existing object or concept that can be regurgitated by specialists, stars or "influencers" (be it a news-event, a commodity, a type of personality, an ideology, a moral attitude, fascism: yes or no, anti-fascism: yes or no, leftism, veganism, a new and "correct" way to say something, a lifestyle, a "real-life story" to be watched alone at home as a compensation for your lack of real life...); only then can this information be given a fixed and official rank of quantitative importance in the spectacle, creating mini-worlds of bits-and-pieces with which you have to be familiar; information-things or culture-things separated from each-other or with only one fixed and official relation to each-other, with the result that you would never be able to think dialectically about anything around you, including yourself and your life, to develop a subjective understanding of your world, of the causes of, the need for or the use of what is shown to you, of what is really desirable for you or not.

What is now called thinking is not really thinking at all; it has long ceased to be the process of thinking for yourself – a creative, passionate and at times frightening, conflicting and difficult activity – and has been replaced with merely having consequence-less opinions about what goes on in an existing and unchangeable reality, to which you are only coincidently related (usually when the need arises to make you feel guilty about something or to mobilize you for or against a person or a group). This type of "censorship" works in a circular way: it informs you about a supposed reality about which you are only supposed to have an opinion, in which you are only supposed to take a passive part, and by this effect strengthening that same forced passivity and ensuring the past's domination over the future.[32]

Will We Rage Against the Machine...

...or does everyone love Big Brother?

"*A report by Ant Financial's much-maligned social credit system (SCS), Sesame Credit, indicates that 96% of Chinese users born between 1990-1994, and 94% of those born between 1995-1999 have chosen to opt in to the social credit system.*"[33]

"*I couldn't tell which terrified me more: China's all-encompassing network of facial recognition surveillance cameras, or that my countrymen were proudly cheering them on... Many people in*

---

[32] My thanks to T. for most of the previous 4 paragraphs, very slightly re-written by me.

[33] ub.triviumchina.com/2019/01/chinese-users-overwhelmingly-approve-of-social-credit-systems/

China seem to be happy about the physical security promised by the surveillance network. Our mind-set, long ago, was wired to see safety and freedom as an either-or choice. Huawei's Hong-Eng Ko put the public safety argument more bluntly this week, arguing that "if privacy wins, criminals win." The acceptance Qian describes is mirrored in widespread public support for China's various emerging social credit systems as mechanisms of accountability for untrustworthy behavior, as found by Genia Kostka through surveys and Manya Koetse through analysis of social media discussion."[34]

The final subhuman product of the system: docile spectators hoping to eradicate everything in themselves and in others that doesn't reduce them more and more to the level of a predictable machine, who are nervous if they don't think they are being supervised, deludedly dreaming of being defended by the very world that destroys all security. One of the first orders of any revolutionary movement is to make this type of subhuman impossible and to spare no instance in which they can be denounced, demeaned, denigrated, and subjected to condescending pity, while taking every pain to praise and encourage them at whatever acts of rebellion they may belatedly engage in, and understanding that this is something that regularly happens to all of us because it is embedded in the civilization that we must destroy. The first revolutionary act is disobedience.

"The universe is simply a great machine...Man, like the universe, is a machine" – Nikola Tesla (scientist, developer of the Alternating Current)

"...a scientist is ...above all, a choice utterly submissive to the dominant reification of human beings, their reduction to a machine, to their role within the commodity economy which demands the repression of subjective desire, which demands their reduction to a functional machine within the overall process of exploitation and capital accumulation. Trial and error reduced to the fetishism of examining cells or natural elements, separating them, re-combining them, comparing and contrasting them, outside of their usual (natural or social) context, in a lab, narrowed such experiments to what is acceptable to quantifiable capitalist social relations." – "Frankenstein's Monster"

It's not for nothing that scientists are helping China's apartheid system in the Uighur region – science has always been an essential weapon of the ruling class.

Science has become the new religion *[ed. – see Return Fire vol.5 pg33]*, a materialised religion that creates the illusion of 'order', the order of machines, of 'rationality', of people too terrified to give their lives meaning by affirming themselves against an 'objectivity' and 'order' which escapes their grasp, which reduces them to commodities.

With the development of large industry, scientists were almost invariably loyal servants to their capitalist masters and to the commodity economy as a whole. Science in the early years of capitalist development invented for its bourgeois masters machines that gave them the spur to brutally expropriate the peasantry of its means of survival and force them to be wage slaves to the owners of these machines. Now this is being extended in more subtle, less blatantly crude, ways which further reduce the modern proletariat to a docility that no longer needs such openly horrendous methods to satisfy the rulers' rabid thirst for capital accumulation. Today, in parallel to the development of Artificial Intelligence which hopes to make robots more 'human' and 'emotional' (at least within the notion of 'human' and 'emotion' created by a world aiming to repress the unpredictably uncontrollable and the negative) – human beings become more machine-like (though, unlike machines, they become depressed and mentally ill). In the past one might be forgiven for believing that science, in reaction to superstition and religion, had a liberatory potential

---

[34] chinadigitaltimes.net/2019/04/safeguard-or-shackle-chinese-views-on-surveillance/

– its progressive nature more linked to dreamt-of future possibilities than the immediately lived grim reality. Today, as science continues its logic of contributing even further to our "progress", the progress of alienation, the progress towards the abyss, its ice-cold tentacles aim to strangle subjectivity at birth or even at conception. Science and capital aim to short-cut the conditioning process of family rearing, schooling and media manipulation and just stifle revolt when it's only a twinkle in its creators' eyes.

In July 2018, scientists endorsed the use of genome editing to engineer the traits of future children and generations *[ed. – see Return Fire vol.3 pg26]*. In August 2018 there was a report about scientists having discovered how to suppress the part of the brain that experiences anger and the desire for revenge. More recently (at the end of March 2019), scientists discovered the DNA of a genetic mutation that suppresses pain and anxiety. It also *conveniently* induces forgetfulness. Now imagine how the rulers of this society could use combinations of such insights and methods (assuming that these scientists, hoping to entice vast vault-loads of moolah, aren't excessively exaggerating developments that are hardly beyond a wishful-thinking fantasy). Given their record of repressing anything that might threaten, even a little bit, their race to accumulate capital there'll be nothing to stop them investing their surplus value in applying these discoveries to vastly intensify the passivity of those they govern. If it's in their toy cupboard, it's unlikely that they won't eventually play with them. When ideological manipulation and technologically-induced fear proves inadequate, genetic and other forms of biologically-applied manipulation may well come to their rescue. No pain, no anxiety, no anger, no desire for revenge and no sense of life, because those surviving the ecological apocalypse will have forgotten why it all happened and who was to blame, having been genetically modified at conception. A Brave New Night of the pain-free Living Dead: chase all your cares away, Sing Hallelujah ...get happy, get ready for the judgment day... Don't worry – be happy.

Now, of course, these worst-case-scenarios seem like really over-the-top sci-fi, and doubtless reinforcing the separations inherent in class society and indoctrinating people with the ideological justifications that would support such a project would take a bit of time. However, the majority of human beings most of the time do not need to be genetically manipulated to be imbued with the values of the commodity economy. A report from February 2019 about people being prepared to sacrifice other human beings so that robots are not endangered shows how, as Artificial Intelligence develops, so too does reification, entailing, amongst other things, treating electronic objects as more important than human beings, and human beings as lesser objects. Which has long been the case amongst the rulers and their head-cracking cops, but is now being intensified amongst the increasingly atomised novelty-technology-obsessed masses. Thoroughly alienated humans, not content to get angry with people outside pubs for leaning against their precious cars, are now increasingly prepared to feed their robots and let people starve. And in future owners of the cars leant on will have no need to get angry – the cars themselves will get angry on their behalf, because machines can out-do people anyday.

Scientists may act all concerned and moralistic about certain developments,[35] but the mercenary logic of scientists is not merely "indifferent" to such 'moral' questions (which they intermittently roll out to defend themselves against accusations of cold-heartedness), but, given that he who pays the piper calls the tune, the abstract ideology of knowledge-for-knowledge's sake (and

---

[35] E.g. this: theguardian.com/science/2017/nov/13/ban-on-killer-robots-urgently-needed-say-scientists

to hell with the consequences, other than the effect on their bank accounts) means in practice that most are prepared to sell themselves to absolutely anybody and any state.

And already totalitarian ecologists are waiting in the wings ready to harness all these marvelous new methods and inventions *[ed. – see the supplement to this volume of Return Fire; 'Green Desperation Fuels Red Fascism'].* And doubtless the world's ruling class are ready to set up home in the South Pole in the lush countryside, whilst creating the mirage of a Green Earth for the rest of us. They will surely justify an 'orderly' totalitarian control as the only way to protect the planet, even though the result would be protecting a world of people reduced to machines and machines imitating such thoroughly predictable people so that machines and people become indistinguishable, with the result of further reducing the survivors to increasingly anxious survival sickness.
